

Application of Steven Mason et al.

Abstract

A system and method for automating record keeping is disclosed. A client transmits patient information to a remote database via the Internet. The database stores the patient information and provides it to other clients as authorized. In some embodiments, the client inputs patient information in forms that have been pre-populated with known patient information or have only fields that need patient information. In other embodiments, a user completes modules for each patient. One set of modules may be used for all patients or the specific modules used for each patient may be customized. In further embodiments, the invention may be used in a behavioral healthcare services environment.
